EFFECT OF REHEATING ON THE STRENGTH OF
GLASS FIBERS. [1960] 6p (3 figs. omitted) 9 refs.
Order from SLA mi\$1.80, ph\$1.80 61-10157

Trans. of article from an unidentified Japanese journal,
1957, no. 65, p. 190-192.

The tensile strengths of glass fibers containing 67%
SiO₂, 12% B₂O₃, 2% BaO, 9% K₂O, 9.5% Na₂O and
0.5% Al₂O₃ were determined both after heating at tem-
peratures between room temperature and their soften-
ing point and after similar heating followed by etching
with hydrofluoric acid. The heating caused lowering of
tensile strength but removal of a thin surface layer of
heated glass fiber by etching restored the tensile
strength observed before the heating. (Author)
